

Website Summary

What it does and how it works • Version 1.0

What is Aliwer?

Aliwer is a technology systems and cybersecurity consulting platform. The website is both a marketing presence and a working application: it introduces Aliwer's services, lets prospective clients book a free 20-minute consultation, and lets independent experts apply to join Aliwer's partner network. Behind a clean, Apple-inspired black-and-white interface, it runs on a real backend with secure accounts, a booking system, an application pipeline, and an admin dashboard.

Who it is for

- **Clients (businesses)** — organizations that need cybersecurity, cloud, AI, or compliance help and want to schedule a consultation.
- **Partners (independent contractors)** — specialists who want to work with Aliwer and apply to the partner network.
- **Admin (Aliwer team)** — staff who review consultations, approve or reject partner applications, and read inbound messages.

What you can do on the site

- **Explore the brand** — an animated landing page covers services (cybersecurity assessments, cloud consulting, AI integration, compliance, application security, managed security), the consulting approach, and trusted partner brands.
- **Create an account** — sign up as either a Client or a Partner with email and password; sessions are kept securely signed in.
- **Book a free consultation** — clients pick a service, date, and time slot; the booking is saved and a confirmation email is sent automatically.
- **Apply as a partner** — partners submit their expertise and experience; they receive a confirmation email and can track their application status.
- **Get in touch** — a contact form (plus phone numbers and address) lets anyone reach the team directly.

How it works (under the hood)

The site is a full-stack web application. Here is the flow in plain terms:

- **Front end** — a React website styled for a premium, minimal look, with smooth scrolling and subtle motion for a polished feel.

- **Accounts & security** — secure sign-up and login using encrypted passwords and signed session tokens; each area of the site is protected by role (client, partner, or admin).
- **Booking system** — when a client confirms a consult, it is stored in the database and instantly appears in their portal, where they can also cancel it.
- **Partner pipeline** — applications are saved and shown to admins, who can approve or reject them; the partner is emailed the outcome.
- **Automatic emails** — booking confirmations, application receipts, admin notifications, and decision emails are sent automatically.
- **Admin dashboard** — a private control center summarizes activity and lets the team manage everything in one place.

The three portals

Area	Who signs in	What they do
Client Portal	Clients	Book & manage free 20-min consultations
Partner Portal	Partners	Submit & track a partner application
Admin Dashboard	Aliwer team	Review consults, approve partners, read messages

In one sentence

Aliwer's website turns a consulting brand into a working platform — it markets the services, converts visitors into booked consultations and partner applications, and gives the team a secure dashboard to run it all.

Secure the systems that run the world.
